SUMMARY

I help businesses build products that users love by working directly between users, engineering, and the business to turn real problems into shipped solutions. For seven years across B2B and B2C SaaS, ad tech, and marketing attribution, I've done that by running discovery from direct customer contact, building the case from data, and shipping product improvements that move real metrics. My hands-on depth in SQL, JavaScript, and API integrations means I investigate problems firsthand and scope solutions with engineers as a peer, not just a translator.

CORE SKILLS

Product Discovery & Voice-of-Customer · Outcome-Driven Roadmapping · PRDs, Specs & Prototyping · Assumption Testing & A/B Validation · Cross-Functional Leadership (Product, Eng, Marketing, Ops, Support) · GTM & Lifecycle Systems (inbound → CRM → outbound, enrichment, attribution) · Process Design & Enablement · AI Workflow Automation (RAG, agentic AI, MCP) · SQL & Data Analysis · JavaScript & API Integrations · Salesforce (SFDC) Administration · Stakeholder Management

EXPERIENCE

Senior Technical Support Engineer | WhatConverts

February 2023 – Present

Remote, Colorado Springs, CO

Embedded product partner at a MarTech SaaS company, asked by leadership to scope and ship self-directed initiatives across product, marketing, operations, and support. Promoted at every review (Tier 1 → 3 → 4 → 5, the top tier), taking customer tickets in week one.

- Identified documentation as the highest-leverage gap blocking support scale and built an AI-assisted, RAG-based pipeline from scratch (agentic AI and MCP architecture over CRM-exported data): a 5x increase in content production efficiency, a 55% increase in successful self-serve answer rate, and a 19% drop in help-center-to-ticket click-through. Now extending the same system to serve answers directly to support agents.
- Ran continuous discovery as a self-directed function: surfaced recurring customer pain points, mapped them into a prioritized slate of PRDs and project briefs, and built a working HTML prototype to validate direction before committing engineering time, partnering directly with Product, Marketing, and Operations to ship the changes.
- Built and owned customer GTM solutions end to end, integrating full stacks from inbound through CRM to outbound (including enrichment and attribution), using SQL, custom JavaScript, and domain-level configuration to consolidate fragmented tooling and ensure clean data flow across systems.
- Made the case for a pricing tier restructure from usage and support data, validated it through formal A/B testing, and saw it adopted, increasing ACV.
- Built the company's saved SQL query library from the ground up and led training across support and other departments, turning data access from a bottleneck routed through me into a team-wide capability; consistently operate ~20% above the top performance-bonus threshold.
- Serve as the de facto product SME across the company, trusted to translate between how users actually experience the product, what's technically true underneath, and what the business needs.

Technical Support Engineer / SFDC Administration | LeanData

December 2021 – January 2023

Remote

Solutions and systems partner for a Salesforce-native lead routing and revenue-operations platform embedded directly inside customers' SFDC environments.

- Helped emerging-through-enterprise customers design routing and lead-lifecycle systems, taking chaotic Salesforce environments and architecting the structure to organize them, a GTM systems-design role in everything but title.
- Troubleshoot Apex jobs, object configuration, and platform settings as a Trailhead-certified SFDC administrator, joining customer calls directly to provide technical guidance and hands-on setup.
- Completed onboarding and technical training in 30% of the expected timeframe, reaching full contribution well ahead of schedule.

Founder | Solutions Consultant | SolutionsKit LLC

March 2018 – Present

Denver, CO · Remote

- Assisted over 20 customers with website development and a range of integrations, CRM setups, and workflow automations, scoping each from discovery through delivery.
- Built QA testing infrastructure for a client that replaced manual testing with automation, cutting their team's manual QA workload, and partner directly with clients to diagnose pain points and build gameplans anchored to north star metrics and measurable deliverables.

Support Specialist | Workforce Management

February 2019 – December 2021

General and Point Of Sale · Wix.com · Denver, CO

- Partnered directly with QA and Product on new product verticals during early development, translating user success and pain stories into structured product input, an embedded voice-of-customer role feeding the roadmap before launch.
- Managed overnight support operations across multiple departments while personally handling escalations as an early member supporting new product lines, and reviewed agent calls and casework to improve processes and resolve issues at the source.

Earlier (before 2018): 10+ years across customer-facing operations, hospitality and front-of-house management, vendor and event management, and independent business ownership, including founding, scaling, and selling a service business. The stakeholder, customer, and operational foundation behind the systems work above.

PROJECTS

ShortPath · Open-Source Support Knowledge Hub · github.com/Dadpops/ShortPath · End-to-end product ownership

- Identified an opportunity in a workflow I lived in daily, support knowledge scattered across too many tools, and shipped a desktop app to close it: a searchable popup agents summon with a global hotkey that consolidates documentation, saved replies, and SOPs in one place. Owned the full lifecycle from problem definition through public release (Electron, React, TypeScript, Fuse.js); now used daily across WhatConverts' support, CSM, and AE teams.

RIFT PROTOCOL · Browser-Based 2v2 Card Battler · Sole product owner

Play it: genrefighters-production.up.railway.app/rift_protocol.html

- Designing and building a full game as sole owner across systems design, UI, art direction, and real-time multiplayer architecture (Socket.io), with single-player, multiplayer, lore, and tutorial onboarding, end-to-end product lifecycle thinking applied to a product I shipped in my own time.

EDUCATION & CERTIFICATIONS

Self-taught in software development, SQL, API/webhook architecture, and AI tooling (RAG, agentic AI, MCP) while working full time. Transitioned into tech from hospitality management. Course certifications listed at linkedin.com/in/kitcabena.
